github.com/example

Machine learning engineer with eight years in software and data, three of them shipping forecasting models to production. I take a model from a messy data source to a monitored service that operators trust, and I measure it against the baseline it replaces. *(Fictional example candidate.)*

01 EXPERIENCE

Independent — *ML consultant* Lyon · 2024–present

- Two clients, a logistics start-up and a regional energy co-op: demand forecasting and route-time models, from scoping to monitoring.
- Fixed-price scoping, weekly demos, and a hand-over pack so each client can run the system alone; demand forecasts now feed a fleet-sizing plan.

Contoso Energy — *Data Scientist* Paris · 2021–2024

- Substation load forecasting with gradient boosting on weather and calendar features; **12% lower forecast error** than the baseline in a two-substation pilot.
- Owned the pipeline from ingestion to a scheduled batch service with drift alerts and a weekly accuracy report.

Northwind Analytics — *Software Engineer* Paris · 2018–2021

- Python and SQL data pipelines for retail clients; test coverage and CI on every repository.

02 EDUCATION

Fabrikam University MSc Applied Mathematics 2017

03 SKILLS

MACHINE LEARNING	Python · scikit-learn · XGBoost · time series · evaluation
PRODUCTION	SQL · Docker · CI/CD · monitoring
LANGUAGES	English *(native)* · French *(professional)* · German *(basic)*
